

Currently, you have **Chronicle** (Newspaper/Dense) and **Exhibit** (Gallery/Quiet). You are missing the bridge between them: **The Structuralist Design System**.

In the design world, Müller-Brockmann is God. If you offer a template that actually adheres to his mathematical principles, you capture a massive audience of **Architects, Designers, and Brand Strategists** who currently fight InDesign to make their portfolios and brand guidelines.

Do not call it "Müller-Brockmann" (too hard to spell). Call it **"International."**

Here is the specification for the **International** style to ensure it doesn't overlap with the others.

The New Style: International

Archetype: *The Swiss Standard* **Target:** Design Portfolios, Architecture Proposals, Brand Guidelines, Manifestos. **The Vibe:** Objective, Mathematical, Asymmetric, Cold.

1. How it differs from your existing styles

- **vs. Chronicle:** *Chronicle* is dense and text-heavy (like a newspaper). *International* is spatial; it uses whitespace as a physical material.
- **vs. Exhibit:** *Exhibit* is passive and soft (Lato). *International* is aggressive and rigid (Helvetica).
- **vs. Matrix:** *Matrix* is for data/finance. *International* is for visual structure.

2. The "International" System Specs

- **Font: Helvetica Now** (or TeX Gyre Heros for open source).
 - *Rule:* Only **one** font family allowed. Hierarchy is created *only* by size and weight. No italics (Müller-Brockmann hated italics; he viewed them as "emotional" corruption of the grid).
- **Alignment: Flush Left, Ragged Right.**
 - *Strict Rule:* No justification. The "rag" (right edge) must be tight but rhythmic.
- **The Grid: A visible or implied Modular Grid.**
 - Instead of a simple text block, the page is divided into horizontal and vertical zones (e.g., a 3x6 module grid). Text blocks hang from the top-left of these modules.

3. The "God-Tier" Feature: The visible Grid Layer

For this style specifically, add a toggle in your UI: **"Show Grid."**

- **What it does:** It renders the underlying module lines in a very faint cyan!20.

- **Why:** Designers *love* this. It proves the math is real. It turns the document into a blueprint.

Implementation Prompt for Claude

ROLE: SWISS TYPOGRAPHER PROJECT: "INTERNATIONAL" STYLE (THE MULLER-BROCKMANN ENGINE)

OBJECTIVE: Create international.latex. This is a strict, grid-based system for high-end design documentation.

1. THE GEOMETRY

- **Asymmetric Layout:**
 - Left Margin: 1.5in (The "Caption Column").
 - Right Margin: 0.5in.
 - Top Margin: 1.0in.
- **The Module:** Text does not fill the page. It sits in a strictly defined 10cm wide block, offset to the right. The left column is reserved for Section Titles (H2) and Captions, which align horizontally with the body text start.

2. THE TYPOGRAPHY

- **Font:** TeX Gyre Heros (Helvetica).
- **Size:** 9pt / 11pt (Small, dense, legible).
- **Weight:** All Headers are **Bold**. All Body is **Regular**. No Italics.
- **Case:** Section Headers are **Lowercase** (e.g., "typography" not "Typography") - a classic Swiss move.

3. THE ELEMENTS

- **The Rule:** A horizontal black line (0.5pt) separates every major section.
- **The Image:** Images must be full width of the *text block* or full width of the *page*. Nothing in between.

Verdict

Add it. It completes the "Design Trilogy" (Chronicle, Exhibit, International). It is the style that will make users tweet, "*I can't believe a bot made this layout.*"
