

You have excellent coverage of Academic, Fiction, Corporate, and Art. However, you are missing **three critical "God-Tier" archetypes** that represent massive self-publishing markets.

These styles are technically difficult to do in Word/InDesign, making them high-value additions to PagePerfect.

1. The Screenplay System

Name: Cinema

Archetype: *The Hollywood Standard*

Target: Screenwriters, Indie Filmmakers, Playwrights.

The "God-Tier" Insight:

Standard Word docs cannot do screenplays because the industry relies on the **"1 Page = 1 Minute"** rule. This requires strict, non-negotiable geometry (Courier 12pt, specific margins).

- **The Problem:** Writers pay \$250 for *Final Draft* software just to get the margins right.
- **The PagePerfect Solution:** A free LaTeX template that outputs perfectly formatted, production-ready scripts.

The System Specs:

- **Font: Courier Prime** (The gold standard; designed for screens, not just code).
- **Geometry:**
 - Left Margin: 1.5 inch (for 3-hole punch binding).
 - Right Margin: 1.0 inch (ragged right).
 - Top/Bottom: 1.0 inch.
- **The Components:**
 - **Slugline:** INT. COFFEE SHOP - DAY (All Caps, Triple Spacing above).
 - **Action:** Full width text block.
 - **Character:** Centered (3.5 inches from left), All Caps.
 - **Dialogue:** Centered block (2.5 inches from left, max width 3.5 inches).
 - **Parenthetical:** Centered under Character (3.0 inches from left).

Implementation Prompt:

"Create cinema.latex. Use the screenplay LaTeX class logic but hard-coded for speed. Enforce Courier Prime at 12pt with exactly 12pt leading. Define environments for `\slug`, `\action`, `\dialogue{Character}{Line}` that use absolute `\leftskip` margins to mimic the Hollywood standard perfectly."

2. The Cookbook System

Name: Heirloom

Archetype: *The Modern Gastronomy Book*

Target: Chefs, Food Bloggers, Family Historians.

The "God-Tier" Insight:

Cookbooks fail because they mix **Ingredients** (Data) and **Instructions** (Narrative) in the same text stream. It's hard to cook from.

- **The Problem:** You have to scroll back up to see "how much flour?" while your hands are covered in dough.
- **The PagePerfect Solution:** A "**Mise-en-place**" Grid. Ingredients live in a distinct sidebar or colored block, separated from the steps.

The System Specs:

- **Font:** **Bitter** (Slab Serif for headers) + **Lato** (Body).
 - *Why:* Slab serifs feel "kitchen-y" and robust.
- **Geometry:** Asymmetric 2-column layout.
 - Column 1 (1/3 width): Ingredients List + Prep Time + Servings.
 - Column 2 (2/3 width): Numbered Instructions.
- **The Components:**
 - **The "Yield" Header:** A metadata block for "Prep Time: 10m | Cook Time: 45m".
 - **The Ingredient Checkbox:** A tiny, light-grey circle O next to ingredients so users can print and check off items.

Implementation Prompt:

"Create heirloom.latex. Use a minipage layout. For every recipe, the Left Minipage (30% width, ragged right, shaded background black!2) holds the Ingredients list. The Right Minipage (65% width) holds the Method. Use enumitem for bold, numbered steps."

3. The Technical Manual System

Name: Operator

Archetype: *The O'Reilly / Braun Manual*

Target: Developers, Engineers, Product Makers.

The "God-Tier" Insight:

Technical writing requires **Semantic Interruptions**. You need distinct visual containers for "Warnings," "Tips," and "Code Snippets."

- **The Problem:** Most tools just bold the text. Real manuals use icons and colored boxes (Admonitions) so the user doesn't

miss safety warnings.

- **The PagePerfect Solution:** "Admonition Blocks" that look engineered, not decorative.

The System Specs:

- **Font: IBM Plex Sans** (Body) + **IBM Plex Mono** (Code).
 - *Why:* It's the font of mankind and machines. Extremely legible.
- **Geometry:** Wide margins for "**Tufte-style**" **Sidenotes** (optional) or full-width with "Out-denting" headers.
- **The Components:**
 - **The Warning Block:** A box with a thick left border (Red) and a warning icon .
 - **The Code Block:** A light-grey background with syntax highlighting colors (using minted or listings package).
 - **The Keycap:** A graphic style for keystrokes (e.g., [CTRL] + [C]) to look like physical buttons.

Implementation Prompt:

"Create operator.latex. Use tcolorbox to create semantic environments: `\begin{warning}`, `\begin{info}`, `\begin{code}`. Use IBM Plex Sans condensed for headers. Ensure all code listings use a distinct `\ttfamily` with a light grey background."

Summary of the New Portfolio

Category	System Name	Aesthetic
Academic	Symphony	Classical Journal
Editorial	Chronicle	Swiss Newspaper
Trade	Paperback	Bestseller Fiction
Business	Matrix	Annual Report
Art	Exhibit	Museum Gallery
Experimental	Avant-Garde	Brutalist Zine
Script	Cinema	Hollywood Screenplay
Cooking	Heirloom	Gastronomy Grid
Technical	Operator	Engineering Manual

Adding these three makes PagePerfect a **complete publishing engine** rather than just a "book formatter." You capture the three largest non-fiction niches instantly.
